ANGULARJS

How many of you are **developers?**

Which is your **OS**?  
Win? Mac? Linux?

Project setup/configuration can be  
**time consuming**

Several **clients**, several **projects**  
in one machine **is painful**

Trying new things is **difficult**

Can we do **better?**

# Virtual machines

NICKYWIRE

# Meet **Vagrant**

[vagrantup.com](http://vagrantup.com)

# Vagrant: a command line tool for **managing** virtual machines

**Providers:** virtualbox, vmware, ec2, ...

# how does it works

```
$ vagrant init hashicorp/precise64  
$ vagrant up  
...  
enjoy
```

# Vagrantfile

```
Vagrant.configure(VAGRANTFILE_API_VERSION) do |config|

  config.vm.hostname = "myvm"
  config.vm.box = "hashicorp/precise64"
  config.vm.network "private_network", ip: "192.168.33.10"

  config.ssh.forward_agent = true

  config.vm.synced_folder "./www", "/var/www", type: "nfs", id:
"vagrant-root"

  config.vm.provider :virtualbox do |v|
    v.customize ["modifyvm", :id, "--memory", 1024]
  end

  config.vm.provision "puppet" do |puppet|
    puppet.manifests_path = "vagrant/puppet/manifests"
    puppet.manifest_file = "default.pp"
    puppet.options = '--verbose --modulepath /etc/puppet/modules'
  end
end
```

# Base Boxes

```
config.vm.box = "hashicorp/precise64"
```

preconfigured machines, different flavors  
all have the same user: vagrant (password: vagrant)

# Vagrantbox.es

**Vagrant** is an amazing tool for managing virtual machines via a simple to use command line interface. With a simple **vagrant up** you can be working in a clean environment based on a standard template.

These standard templates are called **base boxes**, and this website is simply a list of boxes people have been nice enough to make publicly available.

## Suggest a Box

Do you know of another base box? [Send a pull request](#) and we'll add it to the list below.

## Available Boxes

To use the available boxes just replace {title} and {url} with the information in the table below.

```
$ vagrant box add {title} {url}
$ vagrant init {title}
$ vagrant up
```

The list of boxes was last updated on July 25th, 2014.

Search:

Name	Provider	URL
Debian Jessie 8.0 RC2 64-bit (Minimal, Shranked + Guest Additions 4.3.24 + Puppet 3.7.2)	VirtualBox	<input type="button" value="Copy"/> <a href="http://static.gender-api.com/debian-8-jessie-rc2-x64-slim.box">http://static.gender-api.com/debian-8-jessie-rc2-x64-slim.box</a>

# Network

```
config.vm.network "private_network", ip: "192.168.33.10"
```

how to reach the machine  
private or public

## synced folders

```
config.vm.synced_folder "./myproject", "/var/  
www/myproject", type: "nfs", id: "vagrant-root"
```

share your working directory with the vm  
you can continue using your favorite IDE

vm native

nfs (sry Win users)

rsync

# SSH forward agent

```
config.ssh.forward_agent = true
```

nice if you need access to private repo  
don't need to configure the vm

## common settings

```
config.vm.hostname = "myvm"
```

```
config.vm.provider :virtualbox do |vb|
```

```
  vb.memory = "4096"
```

```
  vb.cpus = "4"
```

```
end
```

setting hostname, nice if you ssh in the vm  
setting cpus and memory for performance

# provisioning

```
config.vm.provision "puppet" do |puppet|  
  puppet.manifests_path = "vagrant/puppet/manifests"  
  puppet.manifest_file  = "default.pp"  
  puppet.options = '--modulepath /etc/puppet/modules'  
end
```

configure & install db, files, webserver...

**provisioners:** puppet, chef, ansible, bash, ...

# provisioning with puppet

```
mysql_database{ 'mydatabase':  
  ensure => present,  
  charset => 'utf8',  
  collate => 'utf8_general_ci',  
  require => Class['mysql::server'],  
}
```

```
file { "/var/www/web/logs":  
  ensure => "directory",  
  mode   => 777  
}
```

# VMs management

## creating a vm

```
$ vagrant init  
$ vagrant up
```

# provision a vm

\$ vagrant provision

# stopping a vm

```
$ vagrant halt
```

# reloading a vm

```
$ vagrant reload
```

# destroy a vm

```
$ vagrant destroy
```

# Usage patterns

# one vm, one project

```
.
├── Vagrantfile
├── vagrant
│   └── puppet
│   ...
├── index.php
├── wp-admin
├── wp-config.php
├── wp-content
...
├── wp-cron.php
├── wp-includes
└── xmlrpc.php
```

`config.vm.synced_folder "./", "/var/www/myproj"`

one vm, one project

every project is self contained  
you might end up with a lot of VMs

# one vm, n projects

```
.
├── vmconfig
│   ├── Vagrantfile
│   ├── vagrant
│   └── puppet
│   ...
├── project1
│   └── wp-content
│   ...
├── project2
│   └── wp-content
│   ...
└── project3
    └── wp-content
```

`config.vm.synced_folder` “../”, “/var/www/”

one vm, n projects

good for related apps/projects  
less duplicated vm

# package your own base box

“golden image” pattern  
share a fully configured vm with your team

# package your own base box

```
$ vagrant package mybox.box
```

# package your own base box

```
$ vagrant box add ./mybox.box mybox
```

```
config.vm.box = "mybox"
```

# make your vm accessible

expose your vm on the internet  
testing webhook, debugging, ...

```
$ vagrant share [--ssh]
```

# plugins

extends vagrant functionalities

tons of plugins:

- providers
- provisioners
- host management
- ...

<https://github.com/mitchellh/vagrant/wiki/Available-Vagrant-Plugins>

<http://vagrant-lists.github.io/>

## install a plugin

```
$ vagrant plugin install [plugin]
```

vbguest: keeps vbox guest addition updated  
hostmanager: modifies your host file

# configuring hostmanager

```
if Vagrant.has_plugin?("HostManager")  
  
  config.hostmanager.enabled = true  
  config.hostmanager.manage_host = true  
  config.hostmanager.ignore_private_ip = false  
  config.hostmanager.include_offline = true  
  
  config.hostmanager.aliases=%w(www.myproj.local)  
end
```

## wrap up

tired of configuring projects? vagrant can help!

if you work alone: no shared environment

if you work in a team: share project easily

that's all folks!
